Frequently Asked Questions about Ozone Therapies

What is O3UV ?

UV stands for ultraviolet light. O3 refers to ozone, a molecule that contains 3 oxygen atoms. O3UV is a combination of Ozone Therapy, Major Autohemotherapy (MAHT) and Ultraviolet Blood Irradiation

What is Major Autohemotherapy (MAHT)?

Major Autohemotherapy (MAHT) is when a small amount of blood is withdrawn from a vein, mixed with ozone gas and then reintroduced back into the vein.

What is Ultraimmunotherapy/ Ultraviolet Blood Irradiation ?

Ultraimmunotherapy is a treatment that utilizes ultraviolet light to treat blood. This treatment becomes much more effective when combined with Ozone Therapy. This provides a very powerful tool to fight disease.

How does O3UV work?

O3UV activates and enhances macrophages, a type of White Blood Cell, whose job is to ingest and destroy infectious organisms and foreign substances in your pet's blood and connective tissues. O3UV will help your pet detoxify by eliminating toxic waste which is imperative to healing. O3UV will help regulate a healthy immune system, as well as, reduce inflammation. O3UV will directly inactivate any bacteria, virus or fungi that can cause disease.

O3UV improves circulation and increases cardiovascular protection. O3UV improves oxygenation of tissues and reduces tissue pain. O3UV can take a compromised immune system

that is not able to fend off disease and stimulate it into action. When necessary, O3UV will take a hyper-immune system, as occurs with allergies, and calm it down.

What are some illnesses that can benefit from O3UV Therapy?

O3UV has proven to effectively treat Lyme disease, auto-immune diseases, viral infections, bacterial infections, allergies, kidney disease, liver disease, respiratory conditions and circulatory illnesses. It is also used as adjunctive treatment in all types of cancer. Additionally, it kills most fungi and yeast.

What exactly does the ultraviolet light do in the O3UV treatments?

Ultraviolet (UV) light kills all pathogens or germs. It is germicidal and is the strongest disinfectant on the planet. It has anti-inflammatory effects and boosts the immune system. Ultraviolet light increases the amount of oxygen in the blood and helps it more easily transport oxygen in the blood.

The equipment used on your pet contains 3 types of ultraviolet lamps, UVA, UVB and UVC. All three are used together because they kill off bacteria and viruses, boost the weakened immune system and suppress an overactive immune system.
